MAIL DATE

DELIVERY MODE

07/22/2010

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 09/932,050	Applicant(s) ATSUMI ET AL.	
	Examiner TRACY DOVE	Art Unit 1795	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 13 May 2010.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,4,15-18,23-31,33 and 34 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,4,15-18,23-28,30,31,33 and 34 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

This Office Action is in response to the communication filed on 5/13/10.

Applicant's arguments have been considered, but are not persuasive. Claims 1, 4, 15-18, 23-31, 33 and 34 are pending. This Action is FINAL.

Claims Analysis

Claims 1 and 4 recite a sintered mesophase carbon material prepared by sintering a mesophase carbon material after being molded into a body of the non-aqueous electrolyte secondary cell, which is not given patentable weight because it is a product-by-process limitation. The claim requires a sintered carbon material, in the absence of unexpected results regarding the process limitations. See MPEP 2113.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 4, 15-18, 23-28, 30, 31, 33 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Inamasu, JP 10-312789 in view of Moriguchi et al., US 6,576,369.

Inamasu teaches a nonaqueous electrolyte secondary battery comprising an active material phosphoric acid compound of the formula Li_xFePO_4 (x depends of the valence of Fe) for the positive or negative electrode active material (0007,0011). Note iron has two possible valence states, 2+ or 3+, and phosphate has a 3- charge.

Art Unit: 1795

Therefore, $0 \leq x \leq 1$. The Li_xFePO_4 active material has an average grain size (particle diameter) of 0.1-100 μm (0020). Examiner points out that Li_xFePO_4 is a preferred compound disclosed by the present specification on page 5. It is important to use a small active material to improve cycle characteristics of the battery (0007). When the phosphoric acid compound is used as the positive active material, the negative active material may be a carbon material such as graphite, lithium or a lithium alloy. Graphite intercalates (dopes) lithium (0018). Lithium metal, lithium alloy and carbon material are all typical materials used for the negative electrode active material of the nonaqueous secondary battery (0002-0004). The electrode materials may be baked (0021) or sintered (0023). The nonaqueous electrolyte may include an electrolyte solution comprising an organic solvent (e.g., propylene carbonate) and an electrolyte salt (e.g., LiClO_4) (0012).

The electrodes may include conductive agents, binders or fillers (0013). The electrodes are configured into a film-like structure (molded body) (0009). The negative electrode may include silicon or germanium (0018). Inamasu does not explicitly state the negative electrode material is a binderless sintered material. However, the invention as a whole would have been obvious to one having ordinary skill in the art at the time the invention was made because Inamasu teaches the anode optionally includes a binder (may or may not be present). One of skill would have known that sintered carbonaceous anode materials are generally formed without use of a binder, while non-sintered carbonaceous anode materials are generally formed with the use of a binder. Moriguchi US 6,576,369 teaches "in general, a graphite powder is applied to a

Art Unit: 1795

metal base serving as a current collector with the aid of a suitable binder and is shaped thereon. Alternatively, a sintered electrode may be produced from the graphite powder without use of a binder” (15:31-38). One of skill would have known that sintering causes the particles to adhere (bind) together, thus negating the need for a binder. Inamasu teaches a sintered electrode material. Inamasu teaches a sintered electrode material.

Regarding claims 33 and 34, one of skill would have known that the electrodes could have been configured into any of a plurality of different shapes and sizes. Limitations merely limiting size and or shape are considered obvious in the absence of unexpected results.

The type of starting carbon material is considered obvious in view of the teachings of Inamasu. Product-by-process limitations, in the absence of unexpected results, are obvious.

Response to Arguments

Applicant's arguments filed 5/13/10 have been fully considered but they are not persuasive. Applicant argues a binderless anode molded on the battery advantageously provides an increased anode active material filling density such that the anode has a large reaction area, thereby improving cell energy density and charge/discharge efficiency. However, evidence of unexpected results must distinguish the claimed invention over the prior art of record. Applicant asserts Inamasu is limited to an anode with a binder. This is incorrect. Inamasu teaches the electrodes may include conductive agents, binders or fillers (0013). Thus, Inamasu merely teaches a

Art Unit: 1795

binder for the anode is optional. One of skill would have known that electrodes that are subjected to sintering are typically not formed using a binder. See page 7 of the present specification that discloses no binder is used for a sintered carbon material.

Furthermore, Moriguchi US 6,576,369 teaches “in general, a graphite powder is applied to a metal base serving as a current collector with the aid of a suitable binder and is shaped thereon. Alternatively, a sintered electrode may be produced from the graphite powder without use of a binder” (15:31-38). One of skill would have known that sintering causes the particles to adhere (bind) together, thus negating the need for a binder. Applicant does not address the Examiner’s motivation statement finding the claimed invention obvious in view of the cited prior art.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
